Mining Value Chain

Mining 4.0: Vision, Mission & Goal

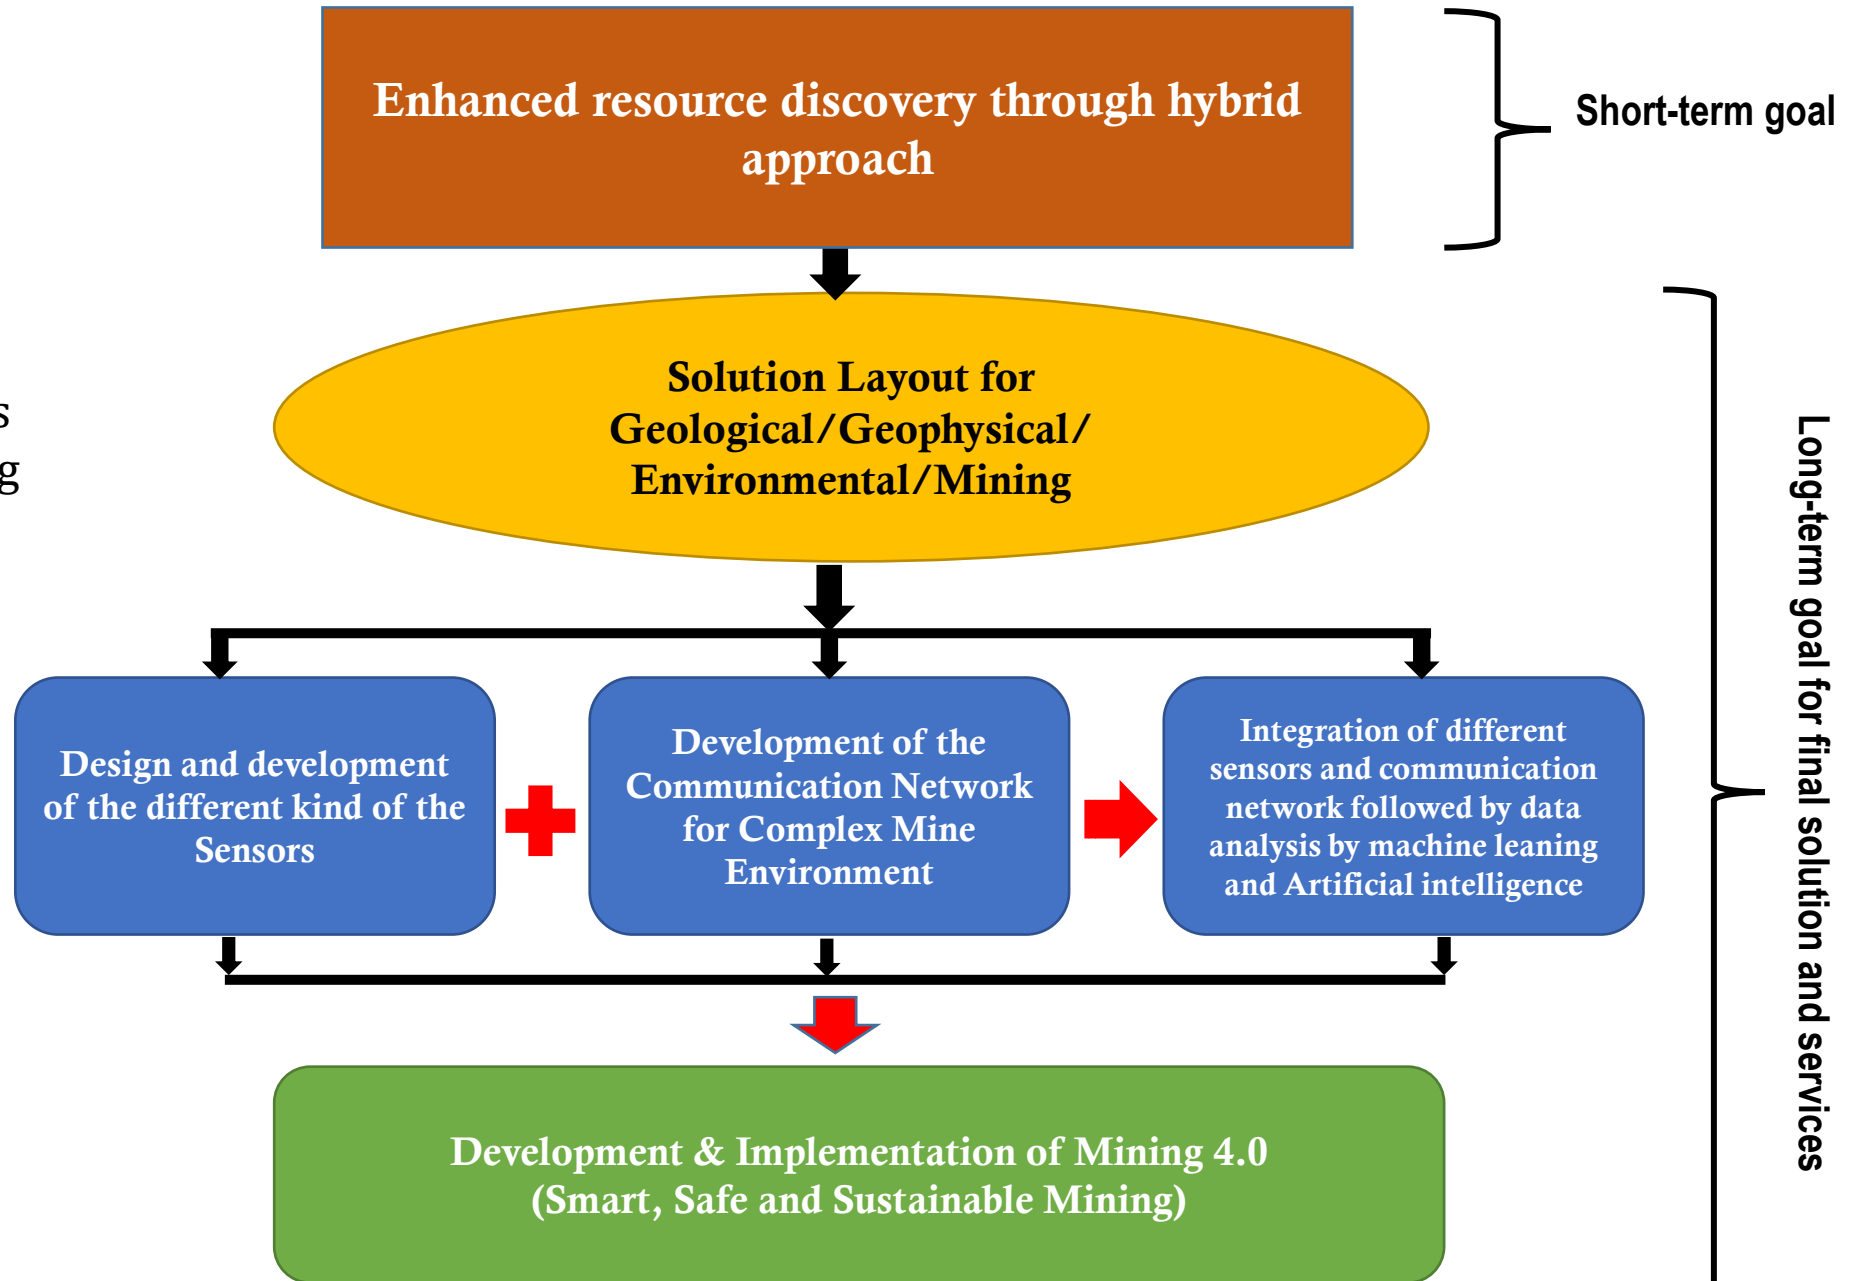

Specific Goals

- Enhance Resource Discoveries and Locating Deep Concealed Deposits
- Get Real-Time Data
- Reduce Risk
- Simplify Mining Operations
- Smart & Sustainable Mining

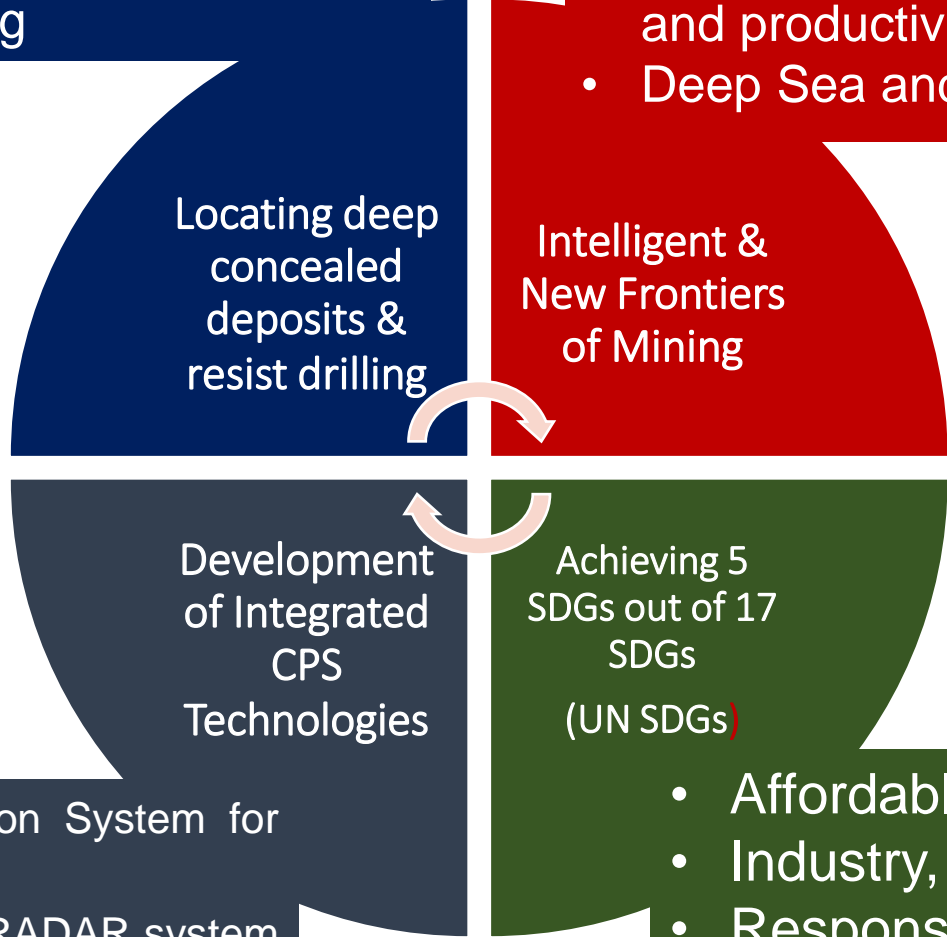

Guiding Factor

- Mass production technologies
- Indigenous Equipment
- Green Mining initiatives
- Promote transparency

- Lower the cost of exploration through pattern matching, predictive analytics and computer Vision systems (AR & VR)
- Development of technologies for locating deep concealed deposits and resist drilling

- CPS based Asset Management System for maximizing availability and utilization
- Mine simulation and data analytics for mine planning, operational Processes, safety and productivity (CMS)
- Deep Sea and Asteroid Mining

MINING 4.0 OBJECTIVES

DELIVERABLES

- Robotic based Surveillance and Evacuation System for Underground Mine Safety
- Development of a low-cost AI/ML portable RADAR system for Monitoring and prediction of Rock and Dump Slopes failure in Open Cast Mines
- Machine learning algorithms for accurate extraction of features in mine areas and characterization of geo-

- Affordable and Clean Energy
- Industry, Innovation
- Responsible Consumption and Production
- Life on Land
- Partnerships to achieve the goal

CPS in Mineral Exploration

Genesis

- The country is endowed with vast resources of a variety of minerals
- GSI has covered 3.11 million sq. km. (99% of mappable area)
- Only 0.57 million sq. km. identified as an Obvious Geological Potential (OGP) area for minerals
- A major part of this OGP area is yet to be fully explored

Challenge

Developing integrated techniques for locating "near-surface" "deep-seated" and "concealed/ hidden" ore bodies

(Geophysical, Geological, Remote Sensing & CPS)

The chance of finding an original deposit is around **0.5%**, with odds improving to 5% if exploration takes place near a known resource (Goldspot, 2020)

Minerals, metals and their products accounted for **25% of total Indian imports**, second only to petroleum and its products

CPS in Mineral Exploration

Key activities

Catalogue of hyperspectral signature of various minerals, IIT ISM Dhanbad has a large bank of mineral samples.

- Gravity survey dataset
- Magnetic survey dataset
- Self-potential datasets

From agencies such as GSI

N-Dimensional
data cube

Development of
AI/ML models
using existing
datasets

Increase
prediction
accuracy

- Ore deposits show gravity and magnetic anomalies with respect to whole survey region.

- Empirical methods of parameter estimation have various assumptions and limitations.
- During survey we encounter with complex datasets.
- Using Machine Learning/AI on training sets, it is possible to extract relationships in parameters and corresponding geophysical anomaly values.
- Using the training sets, it may be possible to detect the depth/geometry from the surface to the top of the body which may help to reduce the drilling cost in exploration.

Genesis

- An average of 0.21 individuals have lost their lives per thousand persons employed during 2011-2018 [DGMS].
- An Import of 235 million tonnes of coal at a total spending of Rs.1,71,000 crore (World's 4th largest coal reserve).
- Need to bridge the demand-supply gap by innovation and adoption of frontier technologies

Challenge

Operation & process optimization across mining value chain through

- Design / development / integration of sensors /communication network
- Data Standardization, and,
- AI/ML/Deep learning with IoT and Block Chain

- **Digitalization of Mining Process in a harsh and dynamic environment | Big Data integration | Operation & Process Optimization**

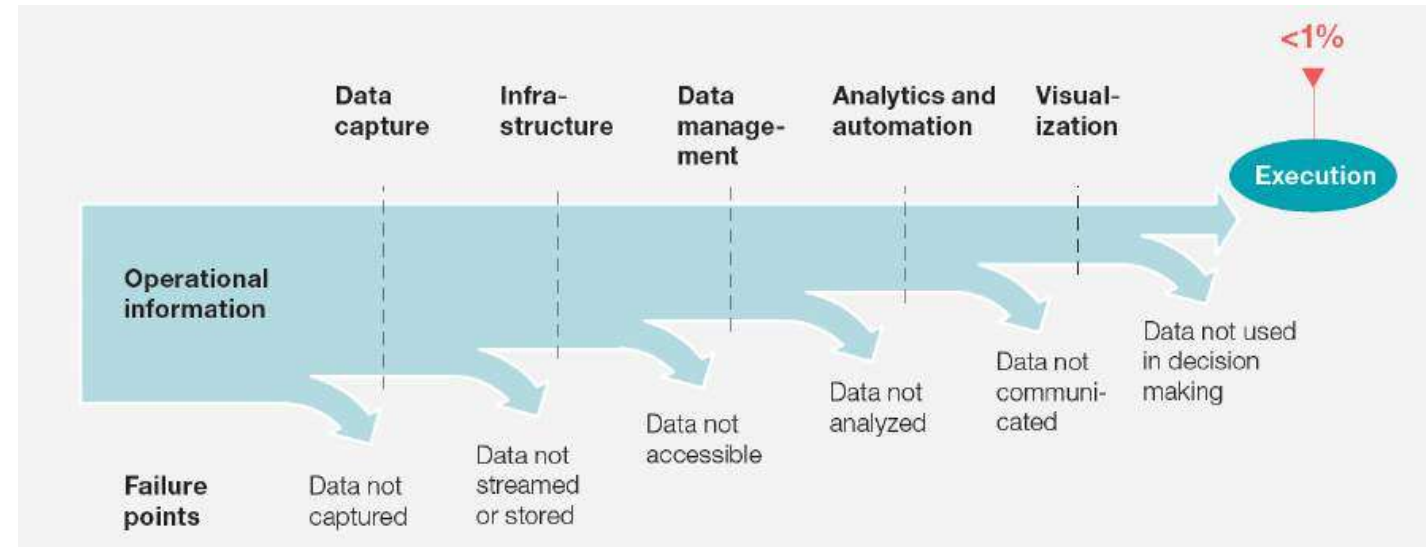

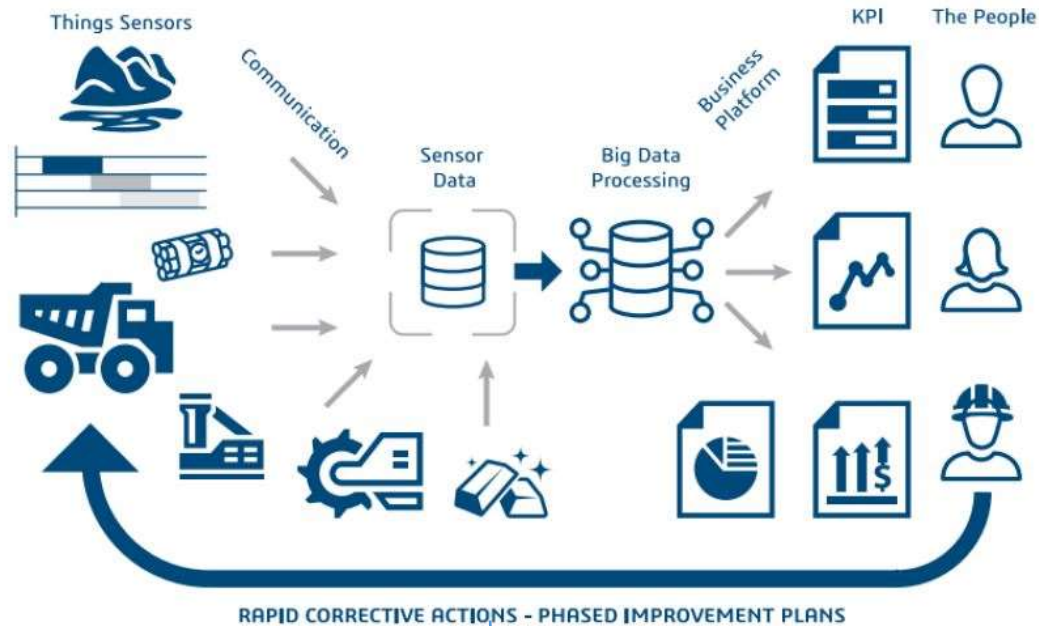

- National Mineral Policy, GoI (2019) emphasizes on the development of robotics, and automated equipment for mining, especially for deep mining

- **Digitalization of Mining Process:** Real-time digital data collection across various operations and make them available for processing & instant decision making (e.g., sensors, portable smart devices, GPS/UPS navigation, LIDAR and drones).
- **Big Data integration:** Enhancing the performance of mining processes and solving complex problems using Internet of Things (IoT) & block chain.
- **Operation & Process Optimization:** Use of big data and robotics (e.g., machine learning, data analytics, automation, remote operation, digital twins).

CPS in Mining: 3S Mining

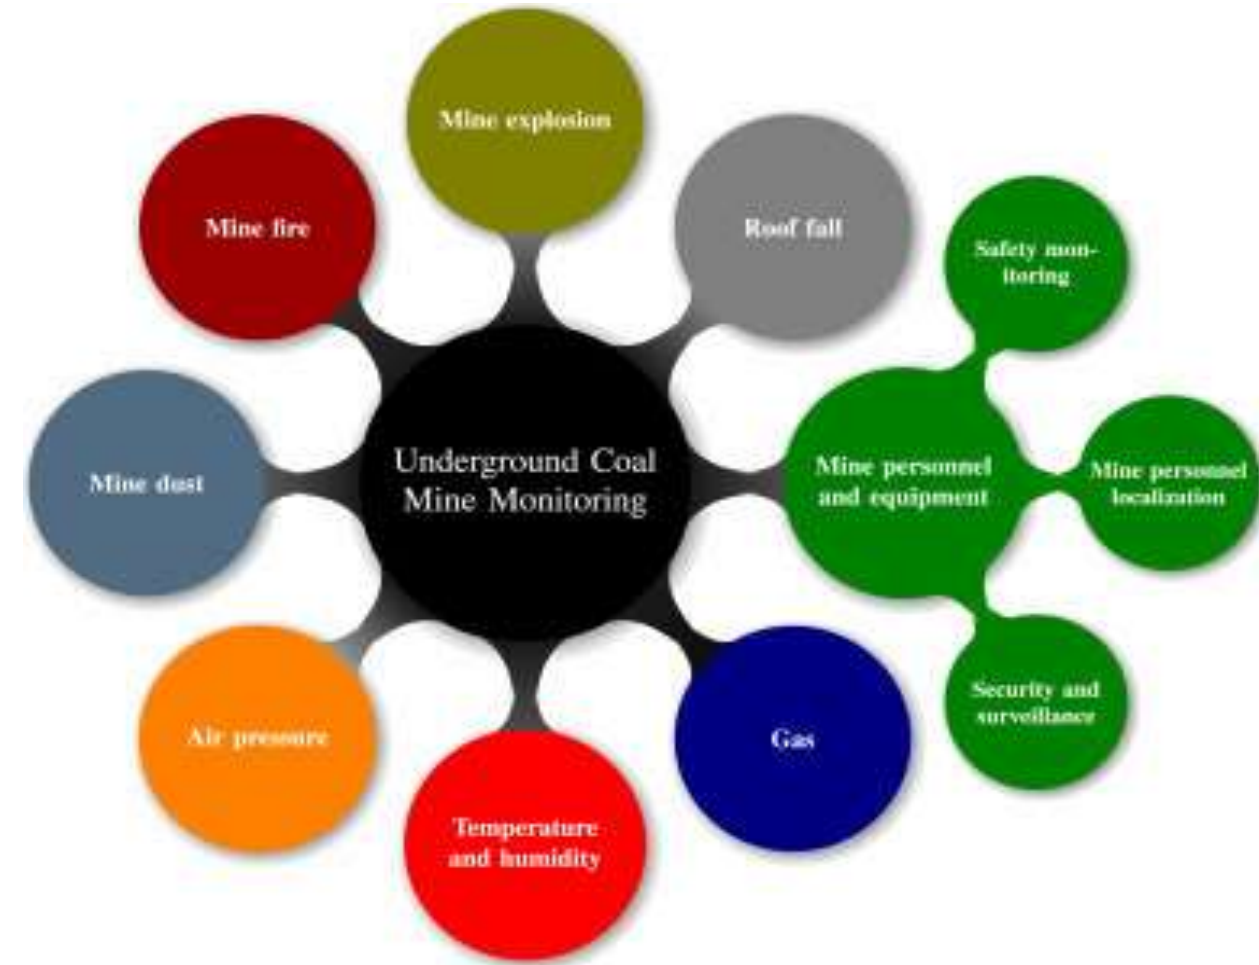

CPS for enhanced safety and productivity

Major and repetitive causes of disasters :

- Spontaneous heating of coal and mine fire
- Methane Explosion
- Inrush of water or unconsolidated mass
- Strata failure
- Roof & Side Fall in Underground mines
- Bench and Waste Dump failure

CPS in Mining: 3S Mining

Parameters requiring real-time detection and monitoring through robust sensors in a hazardous and dynamic environment

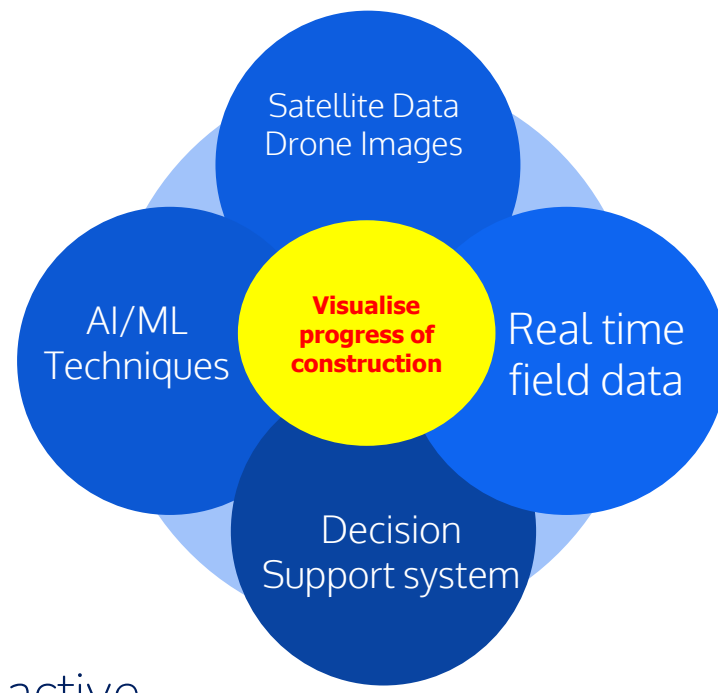

CPS in Semi Automated Self Advancing Goaf Edge Support Systems (SAGES)

The golden triangle of mining 4.0

Smart Sensing Technologies

- Monitoring the mine progress remotely in real-time.
- Fusion of Satellite & Drone data with Artificial intelligence and machine learning algorithms – DSS
- Machine learning algorithms for accurate extraction of features in mine areas.
- With constant monitoring, understanding the changes that is taking place

Development of Integrated monitoring systems

- Providing a safe and cost-effective way to monitor regional stability over active mines.
- Identifying unstable areas over open cuts and capture the extent of subsidence

Possible Applications

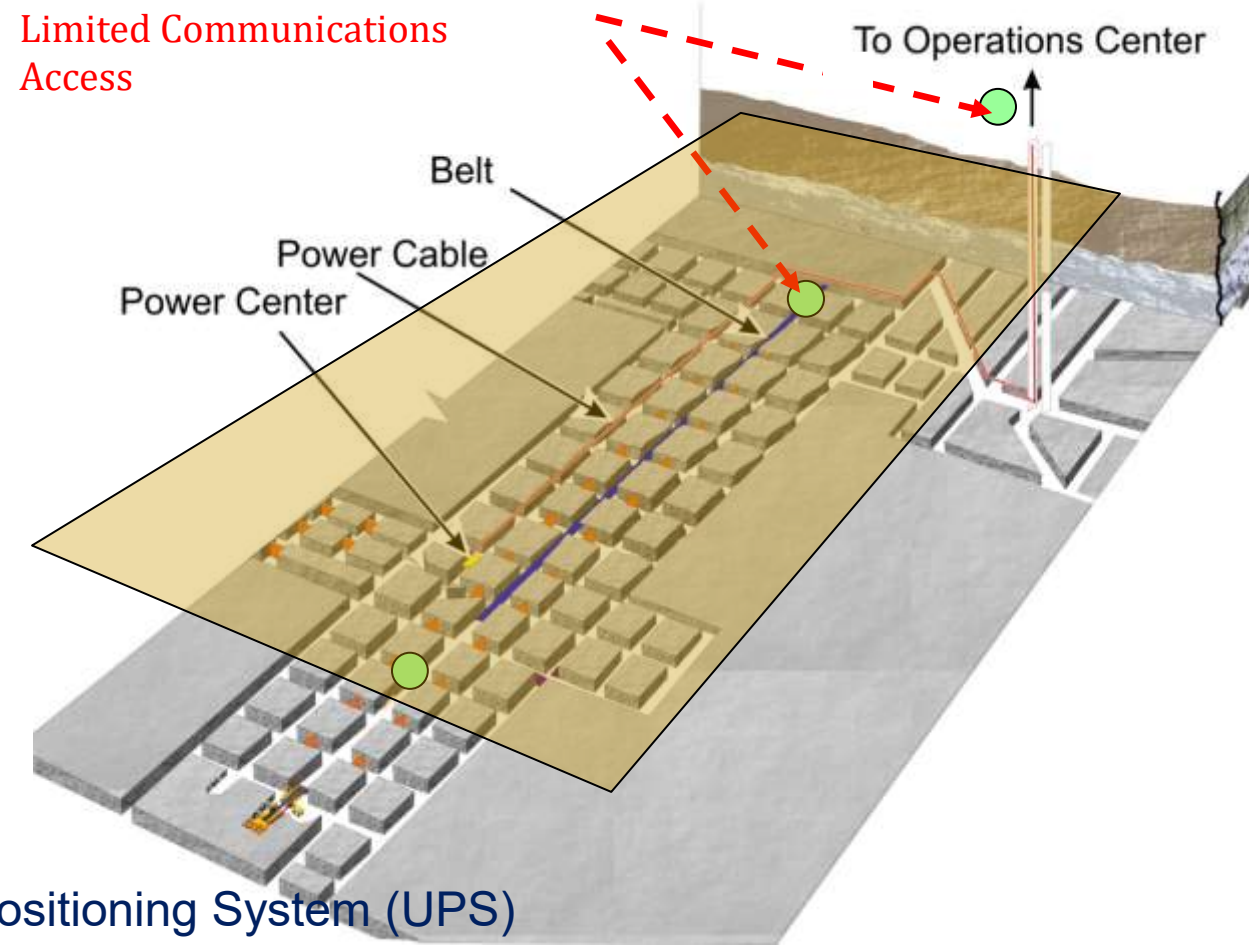

Change detection

- Mining Footprint
- Green Mining

CPS in Mining: Communication issues

- Investigate the shortest and safest route for a miner in the aftermath of fire or explosion.
- locate the personnel when centralized system is disrupted.
- Investigate whether rescuers can be guided with, inside the mine details without jeopardizing their lives in the lethal atmosphere after the explosion.
- Collection of all possible information from the data extraction strategies followed within the mine to help the rescuers
- Development of a system to display all the above information in real-time.

“GPS denied” navigation and tracking: Underground Positioning System (UPS)

Key goal - Miner would be able to communicate smartly for day to day operations
